

AMENDMENTS TO THE ABSTRACT:

Please amend the abstract of the specification as follows:

ABSTRACT

The invention provides an input device of the electronic-~~eipher-code~~ combination lock and a corresponding input method thereof, wherein a signal device produces-~~eipher code~~ combination input information and converts said information into two groups of electrical pulse signals; a measurement and control device measures the electrical pulse signals, decides the order of the electrical pulse signals and calculates correspondingly such that said signals are converted into character sequences including the-~~eipher-code~~ combination elements, and decides whether the current-~~eipher-code~~ combination elements are confirmed to be inputted or not and decides whether the input of all the-~~eipher-code~~ combination elements is completed or not; a confirmation device produces a conformation signal for inputting the-~~eipher-code~~ combination elements; and a display device displays said character sequences and preset prompt information in a rolling and refreshing manner. The invention also provides a door lock handle and a panel of the ~~eipher-code~~ combination lock for the chests and bags applying the above said input device of the electronic-~~eipher-code~~ combination lock. In said input device of the electronic-~~eipher-code~~ combination lock and the application thereof, the operation parts do not contact with the circuit, the reliability and the security protection performance have been improved significantly. Furthermore, the operation for inputting the-~~eipher code~~ combination and the operation for changing the-~~eipher-code~~ combination are very convenient and intuitional.
